

Solutions

Final Exam - ECE 503 Fall 2016

- Date: Wednesday, December 14, 2016.
- Time: 10:30 am -12:30 pm
- Maximum Credit: 100 points

1. [10 points] In the Arizona State Lottery, a player picks 6 different numbers from a sequence of 1 through 15. At a lottery drawing, 6 balls are drawn at random from a box containing 15 balls numbered 1 through 15.

- (a) What is the probability that the player has 0 matches and wins nothing ?
- (b) What is the probability that the player has exactly 6 matches and wins the jackpot ?

Let $n = 15$ be total # of balls

Suppose that the player picks ^{same} m balls ($m = 6$)

Total # of ways to pick m balls out of $n = \binom{n}{m}$

Total " " " k matching balls
 $= \binom{m}{k} \binom{n-m}{k}$

\Rightarrow Probability of
 k -matching balls $= \frac{\binom{m}{k} \binom{n-m}{k}}{\binom{n}{m}}$

$$(a) \text{ Prob. of 0 matching} = \frac{\binom{6}{0} \binom{15-6}{6-0}}{\binom{15}{6}} = \frac{\binom{9}{6}}{\binom{15}{6}}$$

$$(b) \text{ Prob of 6 matching} = \frac{\binom{6}{6} \binom{15-6}{6-6}}{\binom{15}{6}} = \frac{1}{\binom{15}{6}}$$

2. [20 points] Suppose X and Y are independent random variables, and each one of them is uniformly distributed in $[0, 1]$. Let $Z = \min(X, Y)$, and $W = \max(X, Y)$.

(a) Find the joint density (PDF) of (Z, W) .

(b) Are Z and W independent random variables?

$$Z = \min(X, Y)$$

$$W = \max(X, Y)$$

$$F_{Z, W}(z, w) = 0 \quad \text{if } z < 0, w < 0$$

$$F_{Z, W}(z, w) = P(Z \leq z, W \leq w) = P(\min(X, Y) \leq z, \max(X, Y) \leq w)$$

Case A

$$w \geq z$$

$$F_{Z, W}(z, w) = \text{shaded area}$$

$$= F_{X, Y}(z, w) + F_{X, Y}(w, z)$$

$$- F_{X, Y}(z, z)$$

$$= wz + wz - z^2$$

$$= 2wz - z^2$$

Case B

$$w < z$$

$$F_{Z, W}(z, w) = F_{X, Y}(w, w) = w^2$$

$$\Rightarrow F_{Z, W}(z, w) = \begin{cases} 2wz - z^2 & 0 < z < w < 1 \\ w^2 & 0 < w < z < 1 \end{cases}$$

$$\Rightarrow f_{Z, W}(z, w) = \begin{cases} 2 & 0 < z < w < 1 \\ 0 & \text{otherwise} \end{cases}$$

$$(b) f_Z(z) = 2(1-z), 0 < z < 1$$

$$f_W(w) = 2w, 0 < w < 1$$

clearly $f_{Z, W} \neq f_Z \cdot f_W \Rightarrow Z$ and W are NOT independent.

3. [20 points] A wireless communication channel suffers from a clustered error pattern. Whenever a packet has an error, the next packet will have an error with probability 0.9. Whenever a packet is error-free, the next packet is error free with probability 0.99. We want to use a Markov chain to analyze the above process, assuming two states, E (error), and NE (no error).

- (a) Draw a state-transition diagram showing the transition probabilities, and write the one-step transition matrix P .
- (b) Find the stationary probability distribution (and comment on its uniqueness).
- (c) Suppose that the initial probability distribution was $p(0) = [p_E(0) \ p_{NE}(0)] = [0 \ 1]$. Find the probability distribution at time ~~$n=100$~~ $n=5$.

(a)

$$P = \begin{bmatrix} 0.9 & 0.1 \\ 0.01 & 0.99 \end{bmatrix}$$

$$P = \begin{bmatrix} 1-p & p \\ q & 1-q \end{bmatrix} \text{ with } p = 0.1 \\ q = 0.01$$

(b) $\vec{\pi} = \vec{\pi} P$

$$\vec{\pi} = \begin{bmatrix} \frac{q}{q+p} & \frac{p}{q+p} \end{bmatrix} = \begin{bmatrix} \frac{0.01}{0.11} & \frac{0.1}{0.11} \end{bmatrix} = \begin{bmatrix} \frac{1}{11} & \frac{10}{11} \end{bmatrix}$$

The M.C. is irreducible and aperiodic $\Rightarrow \vec{\pi}$ is unique & does not depend on $\vec{P}(0)$.

(c)

$$\lambda_2 = 1 - (p+q) \\ = 1 - 0.11 = 0.89$$

$$\vec{P}(n) = \begin{bmatrix} \frac{1}{11} & \frac{10}{11} \end{bmatrix} + \frac{(0.89)^n}{0.11} \begin{bmatrix} -0.01 & 0.01 \end{bmatrix}$$

$$\vec{P}(0) = [0 \ 1] \quad \vec{P}(5) = \begin{bmatrix} \frac{1}{11} - \frac{(0.89)^5}{0.11} & \frac{10}{11} + \frac{(0.89)^5}{0.11} \end{bmatrix}$$

$$= \begin{bmatrix} \frac{1}{11} - 0.05 & \frac{10}{11} + 0.05 \end{bmatrix} = \begin{bmatrix} 0.04 & 0.96 \end{bmatrix}$$

4. [15 points]

(a) Let $X(t)$ be a wide sense stationary random process, and we define $Y(t) = X(t+5)$. Are $X(t)$ and $Y(t)$ jointly wide sense stationary?

(b) Let X_n have the following PDF,

$$f_n(x) = g_n(x)(1 - 1/n^3) + h_n(x)/n^3$$

where $g_n(x) \sim N(0, 1/n^2)$, and $h_n \sim N(n, 1)$. Does X_n converge to 0 in the mean square sense?

(c) A W.S.S. process $X(t)$, of mean $\mu_X = 10$ is the input to a LTI filter, with impulse response

$$h(t) = \begin{cases} e^{t/0.2} & 0 \leq t \leq 0.2 \\ 0 & \text{otherwise.} \end{cases}$$

What is the expected value of the output process $Y(t)$?

$$(a) \quad Y(t) = X(t+5) \quad E[Y(t)] = E[X(t+5)] = \text{const.}$$

$$E[Y(t)Y(t+\tau)] = E[X(t+5)X(t+\tau+5)] = R_X(\tau)$$

$\Rightarrow Y(t)$ is W.S.S.

$$E[X(t_1)Y(t_2)] = E[X(t_1)X(t_2+5)] = R_X((t_2-t_1)+5) \rightarrow \text{only dep. on } (t_2-t_1)$$

$\Rightarrow X(t), Y(t)$ are jointly W.S.S.

$$(b). \quad E[|X_n - 0|^2] = E[|X_n|^2] = \int_{-\infty}^{\infty} x_n^2 f_n(x) dx.$$

$$= \int_{-\infty}^{\infty} x_n^2 \left[g_n(x) \left(1 - \frac{1}{n^3}\right) + \frac{h_n(x)}{n^3} \right] dx = \underbrace{\frac{1}{n^2} \left(1 - \frac{1}{n^3}\right)}_{\rightarrow 0 \text{ as } n \rightarrow \infty} + \frac{1 + n^2}{n^3} \rightarrow 0$$

$$\Rightarrow X_n \xrightarrow{\text{M.S.}} 0$$

$$(c). \quad Y(t) = h(t) * X(t) = \int_{-\infty}^{\infty} h(\tau) X(t-\tau) d\tau.$$

$$E[Y(t)] = \int_{-\infty}^{\infty} h(\tau) E[X(t-\tau)] d\tau = \int_{-\infty}^{\infty} h(\tau) \times 10 \cdot d\tau.$$

$$= 10 \times \int_{0.2}^{\infty} e^{-\tau/0.2} d\tau = 2 \int_{0.2}^{\infty} e^{-\tau} d\tau = \boxed{2(e-1)}.$$

5. [20 points] Weather analysis in Florida revealed that hurricanes occur according to a Poisson process of intensity $\lambda = 2$ per week.

- (a) What is the average time between two hurricanes ?
- (b) What is the probability that no hurricanes occur during a given 2 week period ?
- (c) If the peak of hurricane season lasts 12 weeks, what is the expected number of hurricanes ?
- (d) Find the probability that during at least one of the 12 weeks of peak season, there are at least five hurricanes.

$$(a) E[X_i] = \frac{1}{\lambda} = \boxed{0.5 \text{ weeks}}$$

$$(b) P(N_2 = 0) = e^{-\lambda \times 2} = e^{-4} = \boxed{0.0183}$$

$$(c) E[N_{12}] = 12\lambda = \boxed{24 \text{ hurricanes}}$$

$$\begin{aligned} (d) P\left(\bigcup_{i=1}^{12} \{N_i - N_{i-1} \geq 5\}\right) &= 1 - P\left(\bigcap_{i=1}^{12} (N_i - N_{i-1} \leq 4)\right) \\ &= 1 - \left[e^{-\lambda} \left(1 + \lambda + \frac{\lambda^2}{2} + \frac{\lambda^3}{6} + \frac{\lambda^4}{24}\right)\right]^{12} \\ &= 1 - \left[e^{-2} \left(1 + 2 + 2 + \frac{4}{3} + \frac{2}{3}\right)\right]^{12} \\ &= 1 - \left[7e^{-2}\right]^{12} = 1 - 0.523 = \boxed{0.477} \end{aligned}$$

6. [15 points] For a zero-mean WSS random process $X(t)$, with auto-correlation function $R_X(\tau) = 1/(1+\tau^2)$, we perform the following sequence of operations. The continuous time process is first sampled at the rate of $f_s = 1$ sample per second. This yields a discrete time random process X_n . We then pass X_n through a discrete-time filter, whose output is denoted by $Y_n = X_n - X_{n-1}$.

- Find the mean and auto-correlation function of X_n .
- Is the discrete time process X_n also WSS?
- Find the mean and auto-correlation function of Y_n .
- Are X_n and Y_n jointly WSS?

(a) $X_n = X(nT_s)$ $T_s = \text{sampling period} = 1 \text{ sec.}$

$$E[X_n] = E[X(nT_s)] = 0$$

$$R_X(k) = E[X_n X_{n+k}] = E[X(nT_s) X((n+k)T_s)]$$

$$= R_X(kT_s) = \frac{1}{1+k^2T_s^2} = \frac{1}{1+k^2}$$

(b) \Rightarrow X_n is W.S.S.

(c) $Y_n = X_n - X_{n-1}$

$$E[Y_n] = 0$$

$$E[Y_n Y_{n+k}] = E[(X_n - X_{n-1})(X_{n+k} - X_{n-1+k})]$$

$$= R_X(k) - R_X(k-1) - R_X(k+1) + R_X(k)$$

$$= \frac{2}{1+k^2} - \frac{1}{1+(k-1)^2} - \frac{1}{1+(k+1)^2}$$

$$E[X_n X_{n+k}] = E[(X_n - X_{n-1}) X_{n+k}] = R_X(k) - R_X(k+1)$$

$$= \frac{1}{1+k^2} - \frac{1}{1+(k+1)^2}$$

X_n, Y_n are also W.S.S.
